**Checklist for MATLAB assignments**

- Did I/we do the right problems?

- Did I/we do every part of each problem?

- Did I/we do everything I/we were supposed to on each part?

- Did I/we use lots of cells, so the output from a command is close to the command?

- Did I/we explain what we were doing before doing it?

- Does the published m-file show all of the output? MATLAB stops executing commands the first time it finds an error. It also won't execute any commands when you publish if the file name contains a hyphen or space.

- Are any of the comments cut off on the right in the printed file? If this happens and the file looks OK in MATLAB's browser, print it from another browser or publish it as a pdf file and print that.

- Is any of the output cut off on the right in the printed file? If this happens and the file looks OK in MATLAB's browser, print it from another browser or publish it as a pdf file and print that. If it doesn't look OK in MATLAB's browser, will it help to simplify and/or use **pretty**?

- Did all of your plots show up? If not, did you print from an email of the html file without having the plot files as well? If that's the problem, you can either email the plot files as well or publish as a pdf and email the pdf (which includes the plots).
