# Math 30530 - Introduction to Probability 

Quiz 5 - Friday November 30, 2012

Solutions

Fully grown Indiana grass snakes have a length that is normally distributed with mean 20 cm and variance $16 \mathrm{~cm}^{2}$ (with the length of different grass snakes being independent of each other).

1. For what length $\ell$ is it correct to say that $85 \%$ of all fully grown Indiana grass snakes have length at least $\ell$ ?
Solution: Let $X$ be he length; $X \sim \mathcal{N}(20,16)$. We want $x$ so that $\operatorname{Pr}(X>x)=.85$. This is the same as $\operatorname{Pr}(Z>(x-20) / 4)=.85$. From a standard normal table, $\operatorname{Pr}(Z<1.04)=.85$, so by symmetry $\operatorname{Pr}(Z>-1.04)=.85$. So we want $(x-20) / 4=-1.04$, or $x=15.84$.
2. The Potawatami Zoo has 9 fully grown Indiana grass snakes. What is the probability that the average length of these 9 snakes is at least 18 cm ?
Solution: Let $X_{1}$ be the length of the $i$ th snakes; each $X_{i} \sim \mathcal{N}(20,16)$, and the $X_{i}$ 's are independent. So $X_{1}+\ldots+X_{9} \sim \mathcal{N}(9 \times 20,9 \times 16)=\mathcal{N}(180,144)$ (note that this is an exact statement, not requiring Central Limit Theorem). We want to know about the average of the 9 lengths, which is $\left(X_{1}+\ldots+X_{9}\right) / 9 \sim \mathcal{N}(180 / 9,144 / 81)=\mathcal{N}(20,16 / 9)$. We want the probability that this is at least 18 , which is $\operatorname{Pr}(Z>-1.5)=.9332$.

Entry is area $A$ under the standard normal curve from $-\infty$ to $z(A)$
