

NURF Project: Nanofabrication of spin-based semiconductor heterostructures
Prof. Jacek Furdyna
Prof. Margaret Dobrowolska-Furdyna

The aim of this project is to expose the undergraduate students to some of the techniques used in fabrication and characterization of spin-electronic (“spintronic”) materials. The students will be involved in the growth of thin-films using the molecular beam epitaxy (MBE) machine (pictured above) available in the Department of Physics.
